

# Problem after Active Directory (Windows/entra) Password change

When I changed my ActiveDirectory password on the MacOS - everything worked. OK, I had to give the new password on several Online Services from Microsoft365 and I've to restart my Teams and so on... But one problem on MacOS kept me a little bit stocked.

The **passwords** on MacOS are stored in the **Keychain Access** Tool and is encrypted with the AD password and this is not changed automatically - so you have to change it manually:

Type into a Terminal:

```
security set-keychain-password
```

And you have to enter the **old** and then the **new** Active Directory Password.
